

# LOWPOLY CITY GENETATOR

## Add third-party Buildings

You can add your own or third-party buildings to the city.

The **LowPoly City Generator** categorizes buildings by type. Below is a list of the available building types:

|           |                                                           |
|-----------|-----------------------------------------------------------|
| <b>BC</b> | Downtown street building (not on a corner)                |
| <b>EB</b> | Corner buildings in suburban areas                        |
| <b>BB</b> | Buildings in suburban areas (not on a corner)             |
| <b>BR</b> | Residential buildings in suburban areas (not on a corner) |
| <b>HS</b> | Houses in suburban areas (not on a corner)                |
| <b>BK</b> | Buildings that occupy an entire block                     |
| <b>SB</b> | Large buildings that occupy bigger blocks                 |
| <b>DC</b> | Corner buildings that occupy one side of the street       |
| <b>MB</b> | Buildings that occupy both sides of the street            |

## Steps to add a third-party building:

### 1. Choose the correct building base

- a. The ground where buildings are placed is called a **base**.
- b. In "**Assets/LowPoly City Generator/Buildings/Prefabs/Bases**", you'll find bases categorized by building type.
- c. Select the appropriate base and place it in the scene.

### 2. Place the building

- a. Drag your building model into the scene.
- b. In the **Hierarchy**, place the building inside the corresponding base object.
- c. Rename the base object to match the building name.

### 3. Save the building as a prefab

- a. In "**Assets/LowPoly City Generator/Buildings/Prefabs/**", you'll find folders labeled **BB, BC, EB**, etc.
- b. These folders store prefabs for different building types.
- c. Save your building prefab in the appropriate folder.
- d. Once saved, **LowPoly City Generator** will automatically use the newly added building in future city generations.

A video tutorial for this process is available at:

<https://youtu.be/SAAz4kqh9jc>

## Adding Third Party Buildings to the DayNight System

If your third-party buildings have day and night versions of their materials, you can integrate them into the **Day/Night System** so they switch correctly.

### **Steps to set up day/night materials:**

1. Select **DayNight** in the **Hierarchy**.
2. In the **Inspector**, locate:
  - a. "**MaterialDay**": Add the daytime version of the materials.
  - b. "**MaterialNight**": Add the nighttime version of the materials.

### **⚠ Important:**

Only materials that have separate day and night versions need to be included. Materials that remain unchanged do not need to be added.

The **index order** in **MaterialDay** must match the **index order** in **MaterialNight**.

### **Example:**

- When switching to night mode, **MaterialDay[1]** will be replaced by **MaterialNight[1]**.

## Adding Third-Party Props

Cities are generated using street and border prefabs located in:

📁 "Assets/LowPoly City Generator/Roads/Prefabs/Blocks"

📁 "Assets/LowPoly City Generator/Roads/Prefabs/Border"

You can edit these prefabs to add or replace elements.

For example, replace trees, add street signs, lampposts, cones, or any other objects.

⚠️ **Be careful not to place props where buildings or roads should be, as this may obstruct vehicle movement.**
